SECURE-BLOCK

Police Online Reporting System - Macro Project

MILESTONE 3

The following is a comprehensive summary of the recent feature additions, UI enhancements, and bug fixes integrated into the system:

1. Missing Persons & Public Bulletins Board

- Built a fully functional public Bulletins board for citizens to view alerts.
- Designed a modern Cyberpunk/Bento grid UI for the display.
- Created the ManageBulletins interface for Admins to add, edit, and delete bulletins, with proper JWT authorization headers.

2. Backend File Upload Fixes

- Overhauled the Multer middleware to remove strict 5MB file size limits and file extension restrictions.
- Resolved a critical issue where the server silently threw 500 Errors when users uploaded high-res smartphone photos (like .HEIC or .webp) as evidence.

3. Data Seeding & Database Integrity

- Safely injected mock data (12 police officers and specific citizen records) directly into the SQLite database.
- Utilized custom backend scripts to bypass ORM syncs, preventing the accidental dropping of existing tables.

4. Advanced Form Validation & Constraints

- Added strict validation to the Log Incident form to prevent users from selecting futuristic dates.
- Implemented dynamic time blocking that restricts future time selection if the current day is selected.

5. Complaint Details & Tracking Improvements

- Fixed UI logic to properly display the selected Police Station and Assigned Officer details.
- Added missing Email and Address inputs for Victims, and Contact Information inputs for Suspects.
- Updated styles to ensure vital information is rendered in high-contrast bold black text for better readability.

6. UI & Aesthetic Upgrades

- Added a massive, blurred "POLICE" watermark behind the landing page for an enhanced cyberpunk aesthetic.
- Fixed invisible text issues on the Admin Dashboard quick links by enforcing high contrast text classes.

7. System Logic Fixes

- Fixed the "Download PDF" button by migrating the use ReactTo Print hook to its v3 syntax.
